

Setting the Printing Impression

Setting anilox impression: Set an adequate anilox impression to ensure uniform ink coverage on the entire plate without overpressing.

Setting plate-substrate impression: First establish proper plate impression to ensure that the entire plate is only touching the substrate (Kiss Print), after that add pressure (impression) slowly and evenly.

Re-adjust anilox impression: Once the plate-to-substrate impression is correct, adjust the anilox pressure by backing off until the image begins to fade and press again to correct the fading with consistent image quality throughout.
